# **POVRATNE DOBE VELIKIH IN MALIH PRETOKOV ZA MERILNA MESTA DRŽAVNEGA HIDROLOŠKEGA MONITORINGA POVRŠINSKIH VODA**

**Sektor za analize in prognoze površinskih voda**

Urad za hidrologijo in stanje okolje

November 2013

## POVRATNE DOBE VELIKIH IN MALIH PRETOKOV

Večina hidroloških procesov v naravi se zgodi naključno, zato je uporaba verjetnostne teorije in matematične statistike v hidrologiji neizogibna za reševanje hidroloških problemov in za boljši opis hidroloških procesov. Verjetnost nastopa določenega pojava predstavlja eno izmed najpomembnejših analiz hidroloških podatkov, kjer na podlagi predhodnih dogajanj napovedujemo dogodke v prihodnosti. Vsak napovedan dogodek (pretok) pa ima določeno verjetnost nastopa. Zaradi enostavnosti in lažjega razumevanja v praksi verjetnost nastopa prikazujemo z njeno recipročno vrednostjo, to je povratno dobo dogodka.

Povratna doba je ocena časovnega intervala med dogodki. Pretok s povratno dobo 10 let je količinska ocena pretoka, ki se v povprečju pojavi enkrat na 10 let. Pomembno je poudariti, da je pojav dogodka slučajen, saj se v kronološkem smislu dogodki ne pojavljajo vsakih 10 let, ampak pričakujemo, da se bo dogodek pojavil 10-krat v 100 letih, ali v povprečju vsakih 10 let.

Povratne dobe smo izračunali za največje letne pretoke (letne visokovodne konice – Qvk) in najmanjše male letne srednje dnevne pretoke (Qnp). Izračun je narejen za lokacije merilnih mest državnega hidrološkega monitoringa površinskih voda z nizom podatkov vsaj 10 let (slika 1, preglednica 1). V izračunih so upoštevana razpoložljiva obdobja podatkov do vključno leta 2010.

Za računanje povratnih dob smo uporabili Pearson III in Log Pearson III porazdelitveni funkciji, ki sta v hidrološki praksi najpogosteje uporabljeni metodi. Spadata med troparametrski Gama funkcije, katera izhaja iz eksponentne porazdelitve.

Pri povratnih dobah velikih pretokov objavljamo tudi podatke iz hidroloških študij in hidravličnih izračunov, s katerimi razpolagamo na ARSO, Uradu za hidrologijo in staje okolja. Za vodomerne postaje, ki so bile obravnavane v Hidrološki študiji srednje Save (IzVRS, 2012), so podatki za povratne dobe velikih pretokov v celoti povzeti iz te študije. Za vodomerne postaje, za katere so bili izdelani hidravlični izračuni gladin v okviru projekta BOBER (Nadgradnja sistema za spremljanje in analiziranje stanja vodnega okolja v Sloveniji), so dodani izračuni iz projektne dokumentacije IDZ (idejne zasnove) za zgradnjo in posodobitev vodomernih postaj državnega hidrološkega monitoringa.

V preglednicah so za vsako merilno mesto (vodomerno postajo) za letne visokovodne konice (Qvk) podani pretoki za povratne dobe 2, 5, 10, 20, 30, 50, 100,

300, 500 in 1000 let, kar ustreza verjetnostim nastopa dogodka 0,5, 0,2, 0,1, 0,05, 0,033, 0,02, 0,01, 0,0033, 0,002 in 0,001.

Za najmanjše male letne srednje dnevne pretoke ( $Q_{np}$ ) so podani pretoki za povratne dobe 2, 5, 10, 20, 25, 50, 100 in 1000 let, kar ustreza verjetnostim nastopa dogodka 0,5, 0,2, 0,1, 0,05, 0,04, 0,02, 0,01 in 0,001. Razlika pri prikazanih povratnih dobah je zaradi nadgradnje programa za izračun povratnih dob, saj se je pri največjih letnih pretokih izkazala potreba po izračunih povratnih dob za 30, 300 in 500 let, zaradi česar so bili preračuni za velike pretoke ponovljeni, ne pa tudi za male pretoke.

Pri interpretaciji izračunanih pretokov moramo upoštevati obdobje meritev: čim daljše je to obdobje, tem boljše so ocene pretokov za daljše povratne dobe. Izračun pretokov s povratno dobo 1000 let presega meje običajnih izračunov, oziroma so dobljene vrednosti močno pogojene z izbiro porazdelitvene funkcije. Ker pa se v inženirski praksi pojavljajo zahteve tudi po teh vrednostih, jih v preglednicah tudi podajamo.

Slika 1: Merilna mesta državnega hidrološkega monitoringa površinskih voda, upoštevana v izračunu povratnih dob

Preglednica 1: Seznam postaj s prispevno površino, stacionažo in geografskimi koordinatami
